# Overview

This handout provides a brief overview of the following concepts.

- Reliability
- Difficulty index
- Upper & lower 27% performers
- Point biserial
- Discrimination index
- Response frequencies

# Reliability

- Reliability refers to the consistency or stability of the measure. It tells you the degree to which an assessment produces consistent and stable results.
- There are many methods to estimate the reliability of an assessment. **KR-20** (Kuder–Richardson Formula 20) is the one that ExamSoft provides.
  - Values of KR-20 range from 0.0 to 1.0.
  - Rule-of-thumb: 0.7 is an acceptable value. The higher the better.

# Reliability

- The K-20 value of this exam is 0.77.

## ASSESSMENT PERFORMANCE

**74%**

Average Score  
(36.9/50)

**38%**

Low Score  
(19/50)

**100%**

High Score  
(50/50)

### Assessment Score Reliability (KR-20)

### Total Student Performance Histogram

# Difficulty Index

- It refers to the percentage of students in the class who get the question correct.
- Take question #1 as an example: 82% of the students got it correct.

# Difficulty Index

**Note:** If < 60% of the class get the question correct, the question needs further analysis.

Some possible reasons for students' low performance on a specific question:

- 1) The question is **too difficult**. You might need to review the content in the class.
- 2) The question is **unclear**. You might need to revise it so that it is more clearly written.
- 3) You have explained the concept thoroughly in the class, but students might have **not studied the concept adequately**. Remind students to review the material.

# Upper & Lower 27% Performers

- They refers to “students whose exam score is among the top or bottom 27% of the class.”
- Take question #1 as an example:
  - 100% of the “upper 27% performers ” got this question correct.
  - 64% of the “lower 27% performers” got this question correct.

# Point Biserial

- It tells you whether getting the question correct correlates with performing well on the exam.
- Take question #1 as an example: Lisa got question #1 correct, and she earned a higher score on the exam than Ben who didn't get question #1 correct. In this case, performance on question #1 predicts students' performance on the whole exam. In the example below, the point biserial of question #1 is 0.45 (very high).
- **0.2 +:** Good association with overall exam performance. The higher the better.

# Discrimination Index

- It tells you how well the item discriminates between high and low performers.
- **How it is calculated:** Percentage of the “upper 27% performers” who got the item correct – the percentage of the “lower 27% performers” who got the item correct.
- Take question #1 as an example: Discrimination Index is  $0.36 = 100\% - 64\%$ .
- **0.2+:** Discriminating; **0.3+:** Highly discriminating. The higher the better.

# Response Frequencies

## Take question # 6 as an example:

- 0 student choose A
- 38 students chose B
- 4 students chose C
- 124 students chose D [\*Correct answer ]
- 0 student chose E.

## Question for you:

- Which is a good distractor?
- Which is not a good distractor?
